Abstract. T. Palmer gave the definition of a spectral seminorm and some equivalent statements for the seminormed algebras to be spectral. Some of these statements have been studied in the locally m -convex case and in the locally pseudoconvex case. In this paper we give some analogous results for the locally m -pseudoconvex algebras. Moreover, different proofs for some known results are given.

1. Introduction

In 1947 I. Kaplansky introduced in [9] the notion of Q -algebra (more exactly of Q -ring), that is a topological algebra E in which the set $Qinv(E)$ of quasi-invertible elements of E is open. Examples of Q -algebras can be found in [5] and [6]. It is well known that every Banach algebra is also a Q -algebra. The importance of Q -algebras has been given, for example in [7], [8],[10]. Nowadays Q -algebras are involved in modern differential geometry (see [12, Chapter XI]) and play a significant role in PDE's theory, operator theory, and the Ψ^* -quantization (see [7, p. 73]).

In 1987 V.Mascioni [13] gave several equivalent conditions for a unital complex normed algebra to be a Q -algebra. Later on T. W. Palmer introduced in [14, p. 294] the notion of a *spectral algebra* as an algebra E in which there exists a seminorm (*spectral seminorm*) p such that $r(x) \leq p(x)$ for each $x \in E$, here $r(x)$ denotes the spectral radius of x . He gave there analogous results to V. Mascioni for seminormed algebras and M. Fragouloupoulou in [6, p. 85, Theorem 3.1] for locally m -convex algebras.

Several characterizations of locally m -pseudoconvex Q -algebras are given in the present paper.

2010 *Mathematics Subject Classification.* 46H05, 46H20.

Key words and phrases. Topological algebras, locally m -pseudoconvex algebras, spectral algebras, Q -algebras, spectral algebras.
